

Package: bindrcpp (via r-universe)

October 10, 2026

Title An 'Rcpp' Interface to Active Bindings

Version 0.2.4.9023

Date 2026-10-10

Description Provides an easy way to fill an environment with active bindings that call a C++ function.

bindrcpp: An 'Rcpp' Interface to Active Bindings

Description

Provides an easy way to fill an environment with active bindings that call a C++ function.

Details

Use `LinkingTo: bindrcpp` in `DESCRIPTION` and `#include <bindrcpp.h>` in your C++ headers and/or modules to access the C++ functions provided by this package:

- `create_env_string()` creates an environment with active bindings, with names given as a character vector. Access of these bindings triggers a call to a C++ function with a fixed signature (`GETTER_FUNC_STRING`); this call contains the name of the binding (as character) and an arbitrary payload (`PAYLOAD`, essentially a wrapped `void*`).
- `create_env_symbol()` is similar, the callback function accepts the name of the binding as symbol instead of character (`GETTER_FUNC_SYMBOL`).
- `populate_env_string()` and `populate_env_symbol()` populate an existing environment instead of creating a new one.
